

## GROUP 5 | Day 6 | User's Guide

---

### The Computer Science MAZE GAME

#### Overview of the Game:

- The game you will be playing is a puzzle game in which you (the player) will collect letters and other characters found on a standard keyboard to fill out words to complete/solve a riddle. These letters and characters will be randomly placed on a grid-like structure moving around you (the player) for you to collect.
  - These riddles are based upon technical information pertaining to the grade 12 and 11 computer science courses at John Fraser Secondary School.
    - For example, fill in the blank: "I start with // and I'm ignored, what am I? Answer: \_\_\_\_\_" (Correct answer: "comment")
  - There are multiple rounds/difficulties, which you (the player) will advance through during your playtime.

#### How To Play (And Have Fun!):

1. For starters, run the Group 5 LexiQuest code under the ICS4U-2 OpenProcessing class link. It should be found in the LexiQuest Submissions.

2. Next, once the code is running, you should see the following displayed on your screen:
  - A maze at the top left corner with you (the player) in the middle, shown as a dot; you can move with your arrow buttons on a standard keyboard.
  - A starting riddle shown on an additional screen that you must click to open.
  - Your inventory is shown alongside the riddle, in the additional screen.
3. Then, with your arrow keys, move around the maze and when you “collide” with a letter or character, you will collect it in your inventory.
  - To check the letters and characters that you currently possess, open back up the riddles page; your inventory will show what you possess.
4. Next, with the letters and characters you found, answer the singular riddle shown - you should be able to complete/answer it fully with the letters you collect.
  - Then, once you have answered the riddle correctly, a new riddle will automatically be shown, replacing the old riddle.
    - You must then repeat the process of collecting the randomized letters and answering the riddles until you have answered all of them in a given round.
      - Then, you move on to the next round/difficulty.
5. Finally, after every time you complete a riddle, for a brief few seconds, the definition of the correct word (which you inputted) will be displayed, alongside its proper pronunciation with its syllables. This is for educational purposes.

### **Additional Tips & Tricks:**

1. Try to collect all the letters you need before answering the riddles in a given round; it makes it easier for you to visualize all the characters/letters you have.
2. Don't stress out about proper spelling. You are always free to search up a word you don't know how to spell (which you believe is the correct answer).
3. Play to your level! The difficulty ramps up every round so don't stress out if you are having trouble in the later rounds!
